## **Current Status of All Claims in the Application:**

## 1-13. (Canceled)

- 14. (Previously Presented) A guide assembly for reducing lateral movement of a magnetic tape in a tape drive, the guide assembly comprising:
  - a first roller including a perimeter surface, a circumference, a longitudinal axis and a plurality of discontinuous grooves disposed into the perimeter surface, one of the grooves having a groove depth that varies in a direction along a length of the groove.
- 15. (Previously Presented) The guide assembly of claim 14 wherein each of the grooves has a groove depth that varies along the length of the groove.
- 16. (Original) The guide assembly of claim 15 wherein the groove length of at least one of the grooves is between approximately 0.1 percent (0.1%) and ninety percent (90%) of the circumference.
- 17. (Original) The guide assembly of claim 15 wherein the groove length of at least one of the grooves is between approximately one percent (1%) and fifty percent (50%) of the circumference.
- 18. (Original) The guide assembly of claim 15 wherein the percentage of the perimeter surface onto which grooves are disposed is in the range of between one percent (1%) and forty percent (40%).
- 19. (Original) The guide assembly of claim 15 wherein the percentage of the perimeter surface onto which grooves are disposed is in the range of between one percent (1%) and twenty-five percent (25%).

- 20. (Original) The guide assembly of claim 15 wherein each of the grooves is aligned substantially parallel to the circumference.
- 21. (Original) The guide assembly of claim 15 wherein the grooves are semirandomly distributed on the perimeter surface.
- 22. (Original) The guide assembly of claim 14 further comprising a second roller including a perimeter surface, a circumference, a longitudinal axis and a groove disposed into the perimeter surface, the groove having a groove depth that varies along the length of the groove.
- 23. (Original) The guide assembly of claim 14 wherein the groove depth varies between approximately zero inches and 0.05 inches.
- 24. (Original) A tape drive including the guide assembly of claim 14 and a take-up reel and a head assembly.
- 25. (Original) A guide assembly for reducing lateral movement of a magnetic tape of a tape drive, the guide assembly comprising:

a first roller having a perimeter surface, a circumference and a plurality of spaced-apart discontinuous grooves disposed into the perimeter surface, each groove being positioned substantially parallel to the circumference of the roller, each groove having (i) a groove depth that varies between approximately zero inches and 0.02 inches, (ii) a groove length of between approximately 0.1 inches and 0.3 inches, and (iii) a groove width of between approximately 0.005 inches and 0.015 inches.

26. (Currently Amended) A method of manufacturing a tape roller of a guide assembly for a tape drive, the method comprising the steps step of:

providing a rotatable roller having a circumference and a perimeter surface; and

forming a groove <u>having a length and a substantially consistent width</u> into [[the]] <u>a</u> perimeter surface <u>of the tape roller</u> so that the groove is tapered to have a groove depth that varies in a direction along [[a]] <u>the</u> length of the groove.

- 27. (Original) The method of claim 26 wherein the step of forming a groove includes forming a plurality of spaced-apart grooves into the perimeter surface so that each groove has a groove length that is less than the circumference.
- 28. (Currently Amended) A method of manufacturing a <u>tape</u> roller for use in a guide assembly of a tape drive, the method comprising the <u>steps</u> <u>step</u> of:

providing a roller portion having a circumference and a perimeter surface; and

forming a groove into [[the]] <u>a</u> perimeter surface <u>of the tape roller</u> so that the groove <u>is substantially aligned along a circumference of the tape roller, the groove having [[has]] a groove depth that varies along [[the]] <u>a</u> length of the groove.</u>

29. (Currently Amended) The method of claim 28 wherein the step of forming a groove includes forming a plurality of spaced apart discontinuous grooves into the perimeter surface so each groove has a groove depth that varies along the length of the groove.

30-33. (Canceled)

34. (Previously Presented) A guide assembly for reducing lateral movement of a storage tape in a tape drive, the guide assembly comprising:

a first roller including a perimeter surface, a circumference, a longitudinal axis and a groove disposed into the perimeter surface, the groove having a groove length that is less than the circumference, and a groove depth that varies between approximately zero inches and 0.02 inches along the length of the groove.

## 35. (Canceled)

36. (Currently Amended) A method of manufacturing a tape drive, the method comprising the step of:

rotatably mounting a tape roller to a drive housing of the tape drive, the tape roller including a groove <u>having a length</u>, the groove <u>being substantially parallel to a circumference of the tape roller, the groove</u> having a groove depth that varies over [[a]] <u>the</u> length of the groove.

- 37. (Previously Presented) The method of claim 36 wherein the groove has a groove bottom that is substantially linear in a direction along a circumference of the tape roller.
- 38. (Previously Presented) The method of claim 37 wherein a portion of the groove bottom is substantially planar.
- 39. (Previously Presented) The guide assembly of claim 34 wherein the groove length is between approximately 0.1- percent and 90 percent of the circumference.
- 40. (Currently Amended) The guide assembly method of claim [[34]] 36 wherein the groove is aligned substantially parallel to the circumference.

- 41. (Previously Presented) A tape drive including a drive housing and the guide assembly of claim 34 that is coupled to the drive housing.
- 42. (Previously Presented) The method of claim 36 wherein the step of rotatably mounting includes forming the groove into a perimeter surface so that the groove has a groove length that is less than a circumference of the tape roller.
